

Peer-consistency sheaf on a three-model panel

0-cells: models 1-cells: directed pairs (i, j) with stalk $\mathbb{R}^{d_j}$

$(\delta^0 s)_{(i, j)} = W_{ij} s_i - s_j \rightarrow$ resolvable cross-model gap (linear part of the pairwise residual)

$(\delta^1 c)_{(i, j, k)} = \rho_{j \rightarrow k}(c_{(i, j)}) + c_{(j, k)} - c_{(i, k)}$

$\rightarrow$ cocycle violation; non-zero iff translations don't commute around the triangle
